

Pipeline report

This page is a **report**, not the experiment. The experiment is defined in `experiment.py` as an importable `main(ctx)` DAG, and run from the command line:

```
bin/mini run docs/pipeline/experiment.py --watch --wor
```

That writes durable, content-addressed results to a memo store. This page reads them back and renders them – it never launches or re-runs the work, so it opens standalone (no GPU, no waiting) and shows the last run's results.

Best config: `lr=0.01` → val_loss **0.2882** (swept 3 learning rates).

task	key	state	metrics
